Automate your Emergency/Business Continuity Planning with The Emergency e-Response Mass Message Notification System

- Automated Emergency Notification System: Voice, SMS, E-mail, Fax and GIS
- Disaster Preparedness Planning Tool
- Mass Message Emergency Civil Notification Auto Dialler
- Provincial Champions Public Alerting Group
- Broadcasting Public Alerting Group
- GIS - Geo Spatial Targeting

The Emergency Response, powered by VoiceGate's dialing engine, scales from 2 ports to 128 ports allowing business, industry and government emergency and business continuity planners to communicate quickly and accurately with their primary and secondary response teams across all industry standard communication devices. Planners can prepare for a crisis by pre-identifying response groups; or groups with specific skill sets and the message they would deliver to that particular group given a certain condition or emergency unfolds. If and when a specific emergency takes place, planners are ready to click a button on the Emergency Response to launch a dialing campaign to a specific group of responders - the system simply picks up all available lines, internet connections and dials to deliver the message to up to five different numbers per responder.

The Emergency Response comes with either a French or English GUI (Spanish is in development), complete with accompanying English, French Canadian (and soon Spanish) text to speech engines allowing planners to communicate with their responders in both of Canada's official languages.

Planners can easily change messages by simply typing them into the system. Pull down menus allow for quick changes of the dialing scenario the system will execute to deliver a specific message to a specific group or sub-group of responders. Available scenarios are: Message delivery (dial, deliver message); Fit For Duty (dial, identify responder, "are you fit for duty" deliver message); Fit For Duty - Arrival (dial, identify responder, "are you fit for duty" deliver message, "Enter when you will arrive"), Voice Casting (dial, identify responder, pull them back into a conference call); Automated Contact Verification (dial, identify responder, automatically update responder,s contact information).
